

VEHICLE COMPONENT APPLICATIONS

- **Vehicle Listing Index**
- **Vehicle Component Applications**

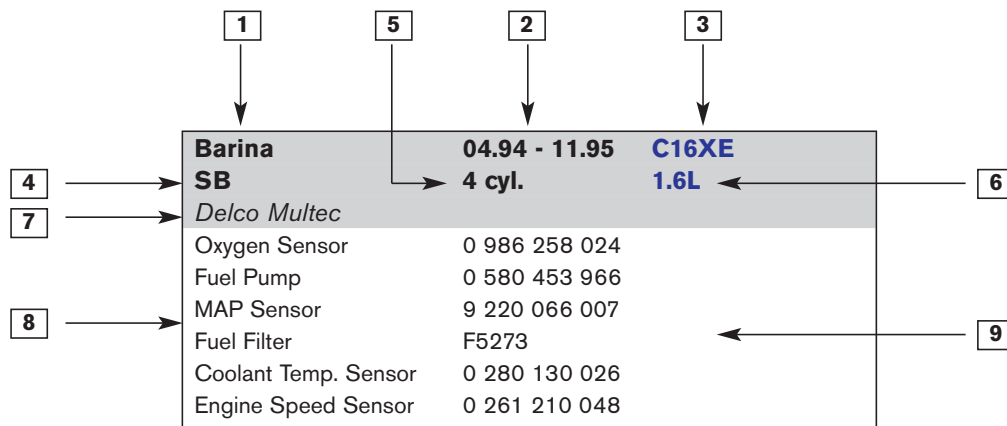

HOW TO USE THIS CATALOGUE.

In order to make this catalogue as simple as possible to use, we have introduced a new format. Our new format allows all engine management products available to be located in one place, as well as simplified and consolidated vehicle model listings.

To make the correct selection of vehicles clearer, we have used a **BLUE HIGHLIGHTING** system to indicate important details related to various vehicles. Where multiple models are listed, the points of difference between models is generally highlighted. As different manufacturers use different details to identify their models, this highlighting will provide extra guidance and hopefully make selection of models simpler and more accurate.

Below you will find an explanation of the vehicle title fields used throughout this listing.

1. Vehicle Model Name or Designation
2. Date of Production - normally the "Build Date" of the vehicle.
3. Engine Type or Code
4. Vehicle Series or Type Code
5. Number of Cylinders / Configuration
6. Engine Size / Displacement
7. Engine Management System Type / Manufacturer
8. Component Listing
9. Comments - Includes specific details about part application, chassis #'s, engine type, body type etc.

<u>Cleaning and Servicing of K & KE-Jetronic Fuel Injectors.</u>		
<i>The cleaning of electronic fuel injectors has been a common practice for many years. The process of removing chemical build up and foreign material from the surface of the injector pintle has been quite successful with the use of various machines, chemicals and processes.</i>		
<i>Whilst this is seen as a successful alternative to costly replacement of fuel injectors, the cleaning process is generally not successful however with K & KE Jetronic mechanical type injection valves.</i>		
<i>The simple reason for this is related to the fact that unlike electronic fuel injectors, these valves are completely mechanical in their operation and simply wear out. The malfunction of K-Jetronic type injectors is generally caused by wear and tear of the valve mechanism and not due to contaminants, hence cleaning is generally not an alternative, nor is it successful in the long term.</i>		
<i>Testing of these injectors can be easily and thoroughly carried out using Bosch mechanical injector valve tester # KDJE-P400. This tester allows not only the atomisation of the injector to be observed but also the "break pressure" of the injector, to be sure it will operate as per system requirements. More details of this tester can be found in the "Technical Spare Parts" section of this catalogue.</i>

Technical Information*Noisy External Fuel Pumps.*

Many fuel pump noise issues are related to cavitation caused by insufficient fuel flow to the pump from the fuel tank. Keep in mind that external "Roller Cell" design fuel pumps are not designed to "draw" fuel from the tank. Vehicle design usually ensures that either the fuel pump is mounted low enough to be gravity fed, or a "Pre-Pump" or "Lift Pump" is fitted into the fuel tank of the vehicle.

When a fuel pump is to be replaced it is important to ensure adequate supply of fuel to the main pump exists. Details on how to check this is detailed in the technical information section

Important Note – Fuel pumps that fail due to cavitation/fuel starvation caused by insufficient clean fuel supply are not covered by Bosch warranty

Splitting Injector Bodies - "JECS" Injectors.

Beware of fuel leakage at the body joints of certain types of fuel injectors fitted to early Nissan and some Isuzu engines. the injector body splits where the plastic connector housing meets the metal injector body and can 'spray' fuel across the engine causing an extreme fire hazard. This leakage may only occur at higher fuel pressures such as those experienced at high load and / or turbo boost conditions. It is likely that thermal stress of these injectors may have contributed to this problem. Rectification of this problem will require replacement of the fuel injector, it is advisable to replace all injectors in this situation.

Technical Information**Noisy External Fuel Pumps.**

Many fuel pump noise issues are related to cavitation caused by insufficient fuel flow to the pump from the fuel tank. Keep in mind that external "Roller Cell" design fuel pumps are not designed to "draw" fuel from the tank. Vehicle design usually ensures that either the fuel pump is mounted low enough to be gravity fed, or a "Pre-Pump" or "Lift Pump" is fitted into the fuel tank of the vehicle. When a fuel pump is to be replaced it is important to ensure adequate supply of fuel to the main pump exists. Details on how to check this is detailed in the technical information section

Important Note – Fuel pumps that fail due to cavitation/fuel starvation caused by insufficient clean fuel supply are not covered by Bosch warranty

"This Fuel Pump Makes Too Much Pressure!!" –

Operation of a Typical EFI Fuel System.

Modern EFI fuel systems circulate as much as 200 litres per hour (~ 3 litres/min) of fuel at pressures between 2.5 & 3.5 bar (250 – 350 kpa). The diagnosis of these systems is a simple exercise provided the operation of the EFI fuel system is clearly understood.

Modern electric fuel pumps are "Positive Displacement" type pumps, simply this means that the pump cannot produce pressure unless it is acting upon a restriction. The only "restriction" in the system should be the fuel pressure regulator. This regulator controls the system pressure; the pressure ability or flow volume capacity of the fuel pump will not alter the system pressure.

The fuel pressure regulator is designed to maintain a constant pressure differential across the fuel injector under all engine operating conditions, this value is the regulators "set" pressure and is often marked on the regulator body.

The diagram below shows a typical fuel system arrangement, the cycle of fuel movement can be summarised as follows –

1. Fuel flows from the fuel tank to the main high-pressure pump. A sufficient volume is critical, typically 60 – 100 l/hour.

2. The main high-pressure pump then pressurises this fuel through the lines and filter up to the fuel rail where typically the pressure regulator will be located.

3. The pressure regulator will allow pressure to build until the set pressure is reached, at this point the regulator valve will open and allow the excess fuel to travel back to the fuel tank via the return line.

Suggested procedures on how to check fuel system operation can be located in the article "EFI Fuel Pressure Testing Procedures".

Technical Information

Engine Overheating & Coolant Temperature Sensors.

When repairing a vehicle that has been severely overheated, consider replacing the Coolant Temperature Sensor. These sensors are designed to operate in liquid temperatures ranging from -30° C to +130° C, however in an engine overheat situation the sensor may be damaged. It is suggested that the sensor is physically and electrically inspected prior to reassembly for heat stress, corrosion of the terminals, physical splitting around the joints and electrical malfunction, if in doubt replace the sensor.

Remember that modern engine management systems commonly utilise one sensor to supply various vehicle systems with engine temperature information, hence a faulty Coolant Temperature Sensor may cause various vehicle faults that are not necessarily related to the repairs undertaken.

 Cleaning and Servicing of K & KE-Jetronic Fuel Injectors.		
<i>The cleaning of electronic fuel injectors has been a common practice for many years. The process of removing chemical build up and foreign material from the surface of the injector pintle has been quite successful with the use of various machines, chemicals and processes. Whilst this is seen as a successful alternative to costly replacement of fuel injectors, the cleaning process is generally not successful however with K & KE-Jetronic mechanical type injection valves. The simple reason for this is related to the fact that unlike electronic fuel injectors, these valves are completely mechanical in their operation and simply wear out. The malfunction of K-Jetronic type injectors is generally caused by wear and tear of the valve mechanism and not due to contaminants, hence cleaning is generally not an alternative, nor is it successful in the long term.</i>		
<i>Testing of these injectors can be easily and thoroughly carried out using Bosch mechanical injector valve tester # KDJE-P400. This tester allows not only the atomisation of the injector to be observed but also the "break pressure" of the injector, to be sure it will operate as per system requirements. More details of this tester can be found in the "Technical Spare Parts" section of this catalogue.</i>

Technical Information

Splitting Injector Bodies - "JECS" Injectors.

Beware of fuel leakage at the body joints of certain types of fuel injectors fitted to early Nissan and some Isuzu engines. The injector body splits where the plastic connector housing meets the metal injector body and can 'spray' fuel across the engine causing an extreme fire hazard. This leakage may only occur at higher fuel pressures such as those experienced at high load and / or turbo boost conditions. It is likely that thermal stress of these injectors may have contributed to this problem. Rectification of this problem will require replacement of the fuel injector, it is advisable to replace all injectors in this situation.

Technical Information

Engine Overheating & Coolant Temperature Sensors.

When repairing a vehicle that has been severely overheated, consider replacing the Coolant Temperature Sensor. These sensors are designed to operate in liquid temperatures ranging from -30° C to +130° C, however in an engine overheat situation the sensor may be damaged. It is suggested that the sensor is physically and electrically inspected prior to reassembly for heat stress, corrosion of the terminals, physical splitting around the joints and electrical malfunction, if in doubt replace the sensor.

Remember that modern engine management systems commonly utilise one sensor to supply various vehicle systems with engine temperature information, hence a faulty Coolant Temperature Sensor may cause various vehicle faults that are not necessarily related to the repairs undertaken.

Porsche Turbo K-Jetronic Fuel Injectors.

K-Jetronic fuel injector part numbers 0 437 502 009, 017 & 057 as applied to Porsche 911 & 924 Turbo must not be substituted by other fuel injectors. Whilst technically & physically appearing identical to earlier 004 & 012 injectors, these injectors have a fine thread near the gland nut. This thread is designed to secure these injectors into their unique holders avoiding any possibility of the fuel injectors becoming dislodged under boost conditions. The use of other fuel injectors may result in the injector being loosened or dislodged causing engine performance issues and possible fire.

“Dual Element” Coolant Temperature Sensor – 0 280 130 032.

Many European vehicles utilise the combination of Bosch LH-Jetronic (LH 2.3/4) and EZK/F ignition management systems. As both of these systems require coolant temperature information, these vehicles use a “Dual Element” Coolant Temperature Sensor, part number 0 280 130 032. This sensor [often identified by its black connector plug] is unique in that not only does it contain two independent NTC sensing elements, but is actually earthed through its body. Due to this fact it is important that the mounting area is always clean and free from corrosion and foreign matter to avoid earthing problems. Due to its design principle, this sensor must not be substituted with, or for any other sensor.

Cleaning and Servicing of K & KE-Jetronic Fuel Injectors.

The cleaning of electronic fuel injectors has been a common practice for many years. The process of removing chemical build up and foreign material from the surface of the injector pintle has been quite successful with the use of various machines, chemicals and processes. Whilst this is seen as a successful alternative to costly replacement of fuel injectors, the cleaning process is generally not successful however with K & KE-Jetronic mechanical type injection valves. The simple reason for this is related to the fact that unlike electronic fuel injectors, these valves are completely mechanical in their operation and simply wear out. The malfunction of K-Jetronic type injectors is generally caused by wear and tear of the valve mechanism and not due to contaminants, hence cleaning is generally not an alternative, nor is it successful in the long term.

Testing of these injectors can be easily and thoroughly carried out using Bosch mechanical injector valve tester # KDJE-P400. This tester allows not only the atomisation of the injector to be observed but also the "break pressure" of the injector, to be sure it will operate as per system requirements. More details of this tester can be found in the "Technical Spare Parts" section of this catalogue.

“This Fuel Pump Makes Too Much Pressure!!” –

Operation of a Typical EFI Fuel System.

Modern EFI fuel systems circulate as much as 200 litres per hour (~ 3 litres/min) of fuel at pressures between 2.5 & 3.5 bar (250 – 350 kpa).

The diagnosis of these systems is a simple exercise provided the operation of the EFI fuel system is clearly understood.

Modern electric fuel pumps are “Positive Displacement” type pumps, simply this means that the pump cannot produce pressure unless it is acting upon a restriction. The only “restriction” in the system should be the fuel pressure regulator. This regulator controls the system pressure; the pressure ability or flow volume capacity of the fuel pump will not alter the system pressure.

The fuel pressure regulator is designed to maintain a constant pressure differential across the fuel injector under all engine operating conditions, this value is the regulators “set” pressure and is often marked on the regulator body.

The diagram below shows a typical fuel system arrangement, the cycle of fuel movement can be summarised as follows –

- 1. Fuel flows from the fuel tank to the main high-pressure pump. A sufficient volume is critical, typically 60 – 100 l/hour.*
- 2. The main high-pressure pump then pressurises this fuel through the lines and filter up to the fuel rail where typically the pressure regulator will be located.*
- 3. The pressure regulator will allow pressure to build until the set pressure is reached, at this point the regulator valve will open and allow the excess fuel to travel back to the fuel tank via the return line. Suggested procedures on how to check fuel system operation can be located in the article “EFI Fuel Pressure Testing Procedures”.*

Technical Information

Noisy External Fuel Pumps.

Many fuel pump noise issues are related to cavitation caused by insufficient fuel flow to the pump from the fuel tank. Keep in mind that external "Roller Cell" design fuel pumps are not designed to "draw" fuel from the tank. Vehicle design usually ensures that either the fuel pump is mounted low enough to be gravity fed, or a "Pre-Pump" or "Lift Pump" is fitted into the fuel tank of the vehicle.

When a fuel pump is to be replaced it is important to ensure adequate supply of fuel to the main pump exists. Details on how to check this is detailed in the technical information section

Important Note – Fuel pumps that fail due to cavitation/fuel starvation caused by insufficient clean fuel supply are not covered by Bosch warranty

“Dual Element” Coolant Temperature Sensor – 0 280 130 032.

Many European vehicles utilise the combination of Bosch LH-Jetronic (LH 2.3/4) and EZK/IF ignition management systems. As both of these systems require coolant temperature information, these vehicles use a “Dual Element” Coolant Temperature Sensor, part number 0 280 130 032. This sensor [often identified by its black connector plug] is unique in that not only does it contain two independent NTC sensing elements, but is actually earthed through its body. Due to this fact it is important that the mounting area is always clean and free from corrosion and foreign matter to avoid earthing problems. Due to its design principle, this sensor must not be substituted with, or for any other sensor.
